Created a dedicated workspace named Fabric_Project.
Configured storage components in OneLake, including the Lakehouse (Products), Data Pipeline (Pipeline 1),

PySpark Notebook (Notebook 1), and Semantic Model (model).

Loaded raw data into OneLake files under Files/raw_data/

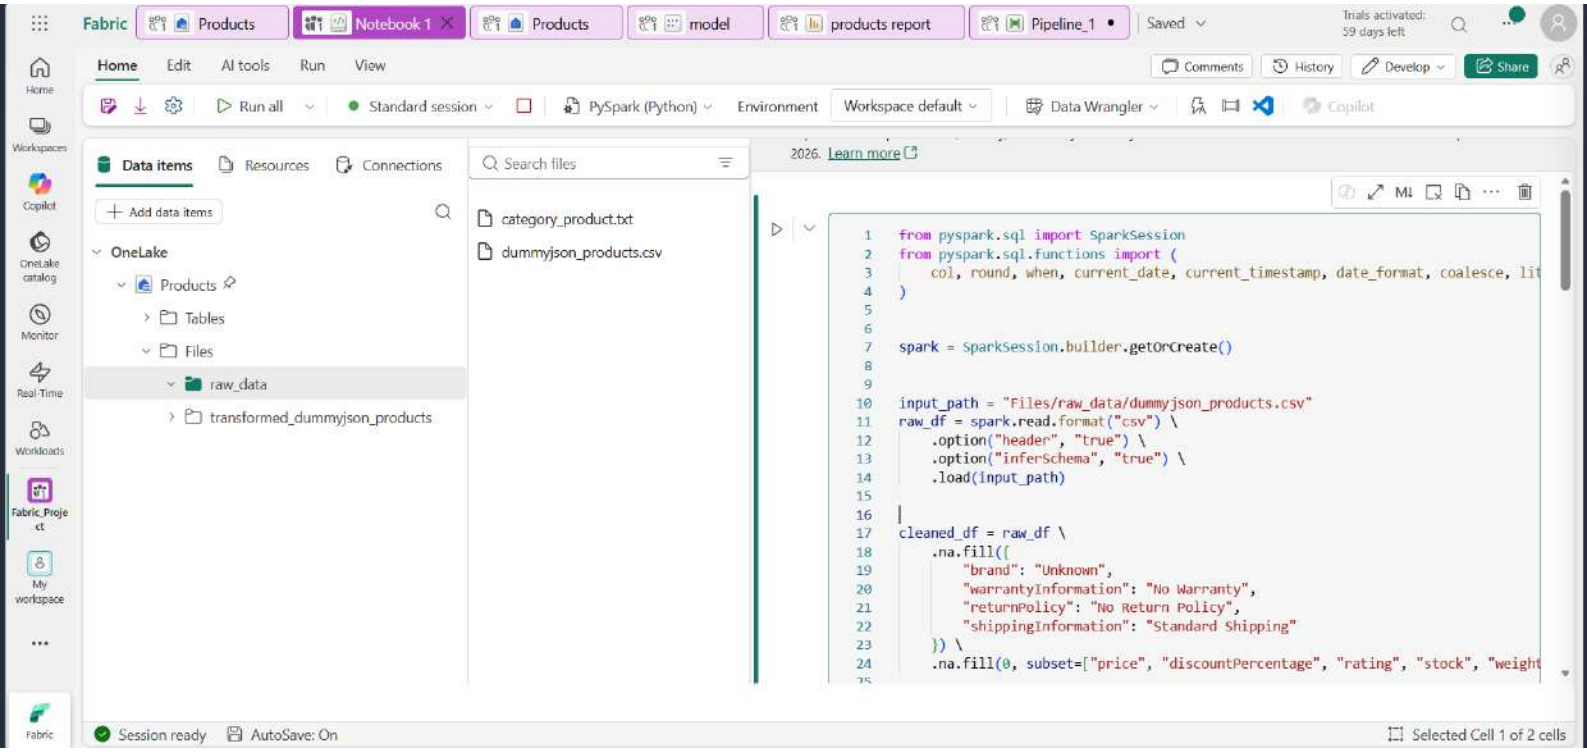

Previewed the resulting fact_products Delta Lake table inside the Lakehouse previewer showing processed columns like price, rating , discount_percentage, and tags.

Executed Notebook 1 to clean missing values (na.fill) across columns .

Structured transformed fields into managed Delta tables (fact_products and dim_category_details).

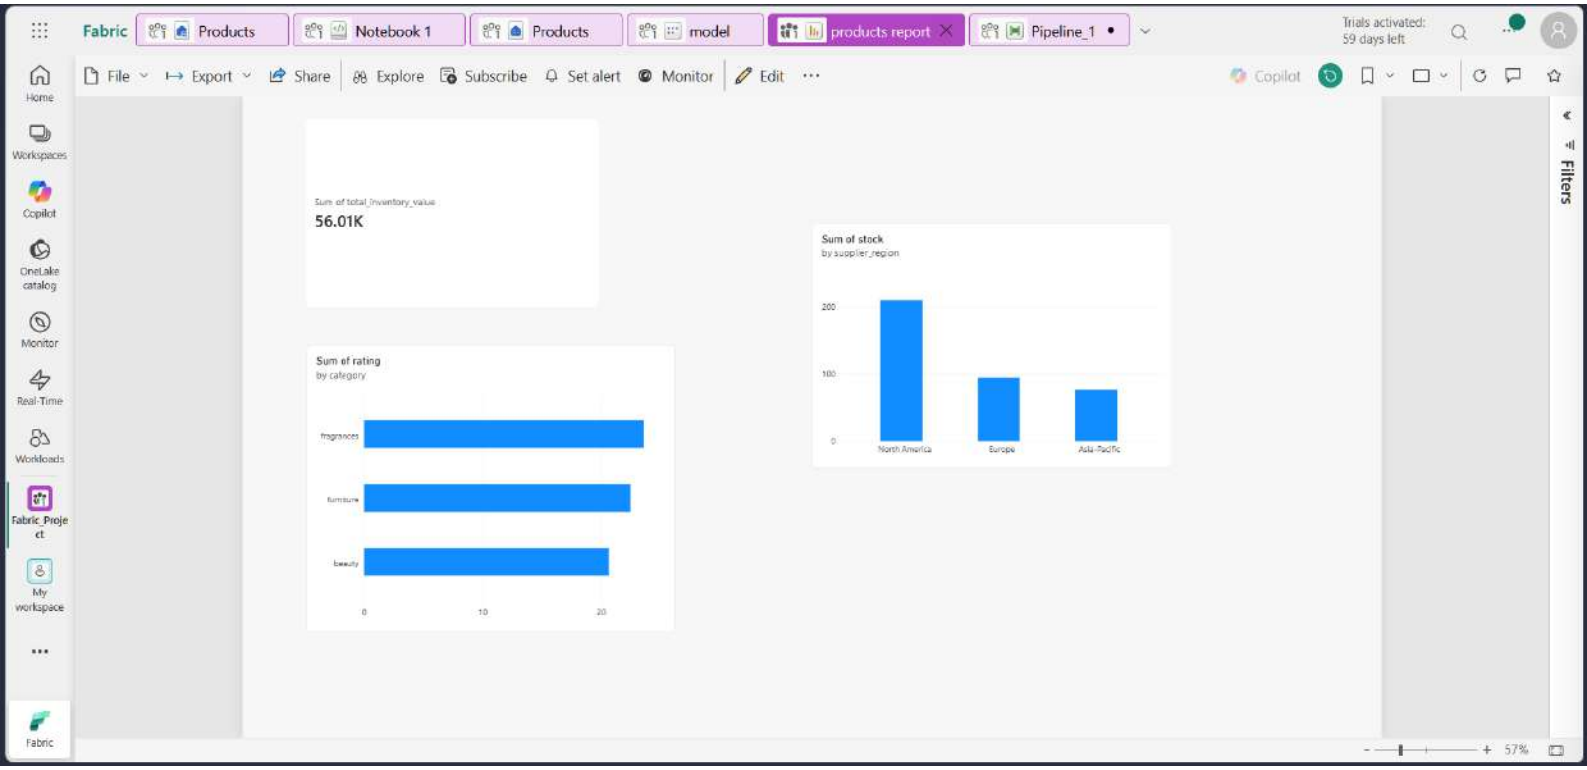

Designed a dimensional model linking the fact table (fact_products) to the secondary lookup table dim_category_details).

Established a 1-to-many relationship on the category key to support slicing and filtering across both sources.

Built an interactive report (products report) directly on top of the semantic model.

Visual 1 (Card): Total Inventory Value
Visual 2 (Bar Chart): Average Product Rating across categories.

Visual 3 (Column Chart): Total Product Stock levels grouped by Supplier Region.

Built Pipeline 1 to orchestrate end-to-end automation.

Linked Notebook 1 to trigger a Semantic Model Refresh automatically upon success

Successful execution status in the Monitoring hub log.
